PRODUCT WHITEPAPER

The M-Series

High-end stage monitors

WHY THE M-SERIES?

On stage, every square metre counts. The M-Series delivers high-output, precision monitoring from enclosures compact enough to stay out of a performer's way. Where M6 is driven in passive mode, M14 can be driven both in active and passive mode.

Coaxial full-range transducers with an 80° conical dispersion pattern ensure consistent, hotspot-free coverage regardless of placement, making the performer's position far less critical and significantly reducing feedback risk.

The M14 maintains outstanding low-frequency performance even at full power, maximising every decibel while preserving clarity and control. Both models are equally at home on demanding tour stages and in permanent installations, thanks to an extensive range of brackets and accessories, they integrate seamlessly as top cabinets, side fills, drum fills, or even front-of-house solutions.

APPLICATION AREAS

The M-Series was developed as a premium monitor line for performers and musicians on live stages, delivering clear, powerful, and reliable monitoring in any condition, whether for live bands, electronic music productions, theatre performances, or corporate events.

Built to withstand the rigorous demands of touring, the M-Series handles intensive use, frequent rigging, and variable conditions. Its ultra-compact design maximises freedom of movement for artists while maintaining exceptional sound quality. With a wide range of mounting options, these monitors integrate equally well as permanent installations in theatres, studios, houses of worship, hospitality venues, and corporate environments.

MODELS

Two models. One principle: maximum output and consistent coverage from the smallest possible footprint. Both operate full-range or low-cut via DSP presets on the P-Series processors.

M6

6.5"/1.75"

Big sound in a micro enclosure. The M6 combines a 6.5" woofer with a 1.75" compression driver for surprisingly high output, low feedback risk, and consistent 80° coverage. Works as a personal monitor, front fill, or stage monitor in theatre and intimate venue settings. Its discrete profile and broad dispersion also make it an excellent permanent installation choice, in studios, theatres, houses of worship, and hospitality spaces.

M14

13.5"/13"

The M14 delivers exceptional SPL from an enclosure weighing just 15 kg. Its 13.5" woofer and 3" coaxially mounted compression driver produce uniform 80° conical coverage without hotspots. Speakon connectors on both sides and the front give flexibility in positioning and cabling. Switchable active/passive is provided.

PRESETS & SYSTEM OPTIMISATION

Every M-Series loudspeaker must be used with dedicated DSP presets to guarantee sound integrity and protection. Monitor, full-range, and lo-cut configurations are ready to load, no lengthy calibration sessions required.

The M-Series is powered by Quint Audio's P-series processors in combination with A-series amplifiers.

KEY BENEFITS

Three reasons the M-Series performs where it matters:

Compact by design

Substantial full-range SPL from enclosures that don't dominate the stage. Maximum output per unit volume, effective across small to large stages, and equally capable as front fill, infill, or near-field monitor.

Consistent coverage

The 80° conical dispersion pattern delivers predictable, even coverage wherever the cabinet is placed. No hotspots, no dead zones, no need for precise positioning. Less correction, less feedback, less stress.

Touring-proof construction

Engineered for the demands of life on the road: intensive use, frequent rigging, and variable conditions. Robust materials, durable finishes, and extensive connection options ensure reliable performance show after show.

The M-Series is built on a single conviction: a stage monitor should work the way the performer expects it to. Compact, powerful, and consistent, from the first sound check to the last show.
