

The P-Series

Professional audio processors ensuring the authentic
Quint Audio sound

WHY THE P-SERIES?

The P-Series was developed for one purpose: to unlock the full potential of Quint Audio loudspeakers and deliver the signature Quint Audio sound, precisely and consistently, in any system.

Speaker presets automatically apply optimised factory settings for a fully linear response, while still leaving room for further adjustment. An intuitive interface gives experienced engineers detailed fine-tuning capabilities, while comprehensive presets enable less experienced users to achieve professional results with minimal effort.

P-series processors are built for future expansion through optional control panels and modular connectivity, ensuring exceptional adaptability for evolving installations and touring systems.

APPLICATION AREAS

The P-Series integrates seamlessly with Quint Audio loudspeakers and A-Series amplifiers across any system configuration, clubs, live concerts, theatres, and permanent installations. Pre-loaded factory presets simplify loading the optimal settings for individual speakers or complete systems, combining exceptional audio performance with straightforward day-to-day operation.

Whether managing a compact club system or a large-scale touring rig with complex routing requirements, the P-Series provides the processing foundation for every Quint Audio system; coherent, calibrated, and consistent from soundcheck to show.

MODELS

Two processors, one platform. Both deliver the full Quint Audio processing standard, the choice between them comes down to I/O requirements and system scale.

P5

4 in / 4 out

The P5 delivers the full Quint Audio processing standard in a more streamlined package. Four analog inputs and outputs handle the majority of real-world setups, clubs, stage monitors, fixed installations, while an integrated 4-channel Dante network card extends connectivity over the network. One AES input (2 channels) adds further flexibility. An extra USB-C input is provided for play-back purposes.

P9

4 in / 8 out

The professional benchmark. 4 Analog inputs and 8 analog outputs, two AES inputs (4 channels), and an optional Dante module, the P9 handles the most demanding touring and installation requirements without compromise. The preferred platform for large systems requiring maximum processing power, connectivity, and precision.

PRESETS & SYSTEM OPTIMISATION

Loading a factory preset file into a P-Series processor ensures immediate adherence to the Quint Audio standard.

This consistency means different speaker configurations sound remarkably similar in character, facilitating rapid assembly of PA systems and enabling targeted optimisations for specific applications such as monitor or front-of-house setups. From initial deployment, every system is precisely calibrated and ready to perform.

KEY BENEFITS

Five reasons the P-Series is the processing platform for Quint Audio systems:

Ready out of the box

Factory presets for every Quint Audio loudspeaker load a fully linear, optimised system configuration immediately. Fast setup, coherent results, whether for a one-off event or a permanent installation.

Network integration

Fully networkable via LAN, with standard Dante on the P5 and optional Dante on the P9. Remote configuration and monitoring from any networked computer, on-site or off-site.

Universal compatibility

Integrates seamlessly with all Quint Audio loudspeakers and A-Series amplifiers. Consistent, signature sound quality across any system configuration, venue, or event scale.

Expert & operator friendly

Comprehensive factory presets give rental operators and less experienced users professional results with minimal effort. Full parameter access satisfies the demands of seasoned engineers.

Built for expansion

Optional control panels and modular connectivity options ensure the P-Series adapts as systems grow. A long-term platform investment that scales with evolving installations and requirements.

The P-Series is the processing backbone of the Quint Audio ecosystem, precise enough for the most demanding engineers, straightforward enough for rapid deployment, and built to scale with any system.
